## PROJECT TITLE:

- Enhancing Road Safety with AI-Driven Traffic Accident Analysis and Prediction

### 1. Problem Statement

Road accidents pose a serious threat to public safety, resulting in significant loss of life and economic damage. Traditional methods of traffic monitoring and accident prevention are often reactive rather than proactive. There is a critical need for intelligent systems capable of analyzing traffic patterns, predicting accident risks, and

providing actionable insights to prevent accidents before they occur. This project aims to leverage AI-driven data analysis and machine learning models to forecast potential accident hotspots and contribute to safer transportation environments.

## 2. Objectives of the Project

- Analyze historical traffic accident data to identify patterns and risk factors.
- Build predictive models capable of forecasting accident-prone zones.
- Develop a real-time alert system to inform authorities and drivers about potential risks.
- Provide actionable recommendations to improve traffic safety measures.
- Build a user-friendly dashboard for visualizing accident trends and predictions.

## 3. Scope of the Project

### Features:

- In-depth analysis of traffic-related datasets (weather, time, road conditions, vehicle types).

- Application of AI techniques like classification, clustering, and time-series prediction.
- Identification of high-risk areas and accident hotspots.

### Limitations:

- Predictions rely heavily on the availability and quality of traffic and accident datasets.
- The model's performance may vary across different geographic regions.

### Constraints:

- Only publicly available or government-published traffic accident datasets will be used.
- Focus will be on prediction and analysis; implementation of physical interventions (e.g., road repairs) is outside the project's scope.

## 4. Data Sources

- **Dataset:** Road Accident Data (e.g., National Highway Traffic Safety Administration, Kaggle public datasets)
- **Sources:**
  - o Kaggle - US Accidents (3.0 million records)
  - o Government traffic accident reports and open datasets.
- **Type:** Public, time-series, and geo-spatial data.

## 5. High-Level Methodology

### Data Collection:

- Download accident datasets from public sources.

### Data Cleaning:

- Handle missing or inconsistent data entries.
- Normalize weather and location features.

### Exploratory Data Analysis (EDA):

- Visualize accident frequency based on time, location, weather, and road conditions.
- Identify correlations between factors and accident occurrences.

### Feature Engineering:

- Create new features like "peak traffic hours", "adverse weather indicator", etc.
- Use geospatial features (latitude, longitude clustering).

### Model Building:

- Models: Random Forest, XGBoost, Decision Trees, LSTM for time-series accident prediction.

- Justification: Ensemble models and sequence models help capture complex patterns and trends.

### **Model Evaluation:**

- Metrics: Accuracy, Precision, Recall, F1-Score, AUC-ROC for classification tasks.
- Validation Strategy: Stratified K-Fold Cross Validation.

### **Visualization & Interpretation:**

- Accident heatmaps.
- Risk-level classification maps.

### **Deployment:**

- Build a dashboard using Streamlit to visualize accident hotspots and risk predictions in real time.

## **6. Tools and Technologies**

- **Programming Language:** Python
- **Notebook/IDE:** Jupyter Notebook, Google Colab
- **Libraries:** pandas, numpy, scikit-learn, matplotlib, seaborn, xgboost, folium (for maps), streamlit
- **Optional Deployment Tools:** Streamlit or Flask for web deployment

## **7. Team Members and Roles**

1. SANJAY.K – DATA ENGINEER
2. SANJAY.U – MACHINE LEARNING ENGINEER
- 3.SANTHOSH BABU.S – FULL STACK DEVELOPER
